

## Don't worry about the world's most advanced piece of ransomware. We've got your back!

Our preferred anti-virus product, Bitdefender has advanced detection technologies which have blocked WannaCry from the very beginning

You might have already heard that a new family of ransomware called WannaCry has infected over 300,000 computers worldwide and millions are still vulnerable. This piece of ransomware is based on a zero-day exploit that helps it jump from one infected computer to another and encrypt all the information stored on it.

We're writing to you to let you know that Bitdefender's advanced detection capabilities based on next-generation technologies were able to intercept this threat since its emergence. If you are a PC Crew Health Check or Care plan customer, your information has been safe all the time.

### **Here is a little background information about this new threat**

Unlike other ransomware families, the WannaCry strain does not spread via infected e-mails or infected links. Instead, it takes advantage of a security hole in most Windows versions to automatically execute itself on the victim PC. According to various reports, this attack avenue has been developed by the National Security Agency (NSA) in the US as a cyber-weapon and it was

leaked to the public earlier in April along with other classified data allegedly stolen from the agency.

Until now, a number of hospitals, telecom companies or gas and utilities plants have suffered massive disruptions caused by data being held at ransom, this however is now spreading rapidly to the home and small business user.

If you are not using a professional security solution we strongly recommend you to install Bitdefender - Get in touch today to arrange a standalone installation and security audit or take advantage of our unbelievable monthly care plan that includes Bitdefender and a whole host of other maintenance, protection and security products for a small monthly fee.
