

Massive GoldenEye / Petya ransomware attack is currently unfolding worldwide.

**Do not worry,
with Bitdefender and the PC Crew Care
Plan you are safe.**

Bitdefender has identified a massive ransomware attack triggered by a version of the GoldenEye or Petya ransomware that is currently claiming victims across the world. Unlike other families of ransomware, GoldenEye does not encrypt individual files, but rather the entire hard disk drive. It then reboots it to prevent the user from accessing that information. When the encryption process is complete, GoldenEye forcefully crashes the computer and asks for \$300 as ransom.

Our initial investigation reveals that it spreads automatically from one computer to another using multiple vulnerabilities in the operating system, including the EternalBlue exploit that grabbed the headlines during the #WannaCry attack.

We're writing you to let you know that you are safe and Bitdefender blocks the currently known samples of the new GoldenEye variant.
